

Experiment -1 Flight Reservation System

1. Create a simple cloud software application for Flight Reservation System using any Cloud Service Provider to demonstrate SaaS include the necessary fields such as one way, round trip, From, to, Departure, Departure, Travelers & Class, Fare Type, International and Domestic Flights etc.

Aim

To develop a cloud-based Flight Reservation System for managing flight details, passenger information, and ticket bookings. The system helps users search flights, reserve seats, and manage booking records efficiently.

Procedure

1. Create a new application named **Flight Reservation System**.
2. Create **Passenger Details**, **Flight Details**, and **Booking** forms.
3. Add fields such as passenger name, flight number, source, destination, departure date, arrival time, seat class, fare, and booking status.
4. Use **Lookup** fields to establish relationships between Passenger and Flight forms.
5. Create reports to display flight schedules, booking details, and passenger information.
6. Test the application by performing flight booking, ticket confirmation, and cancellation operations.
7. Publish the application and verify that all records are stored and retrieved successfully.

Result

A cloud-based Flight Reservation System was successfully developed. The application allows users to search flights, book tickets, manage reservations, and maintain passenger records in an organized and efficient manner.

Experiment 2: Property Buying & Rental System

Question

Create a simple cloud software application for a **Property Buying & Rental System (Chennai City)** using any Cloud Service Provider with fields such as Buy, Rent, Commercial, Rental Agreement, Area, Place, Range, and Property Value.

Aim

To develop a cloud-based Property Buying and Rental System for managing property listings, customer details, and rental or purchase agreements.

Procedure

1. Create a new application named **Property Buying & Rental System**.
2. Create Customer Registration, Property Details, and Booking & Agreement forms.
3. Add fields for property type, location, area, property value, rental amount, and agreement details.
4. Use Lookup fields to connect Customer and Property forms.
5. Create reports for available properties and booking history.
6. Test property booking and agreement generation.
7. Publish the application.

Result

A cloud-based **Property Buying & Rental System** was successfully developed. The application enables customers to view properties, perform buying or rental transactions, generate agreements, and maintain booking records efficiently.

Experiment: 3 Car Booking System

1. Create a simple cloud software application for Car Booking Reservation System using any Cloud Service Provider to demonstrate SaaS include the necessary fields such as search for cabs, from, to, rental , out station, Package type, hours/Days etc.

Aim

To develop a cloud-based Car Booking System for managing car details, customer information, and vehicle bookings. The system enables customers to book cars easily and helps maintain booking records efficiently.

Procedure

1. Create a new application named **Car Booking System**.
2. Create **Customer Details**, **Car Details**, and **Booking** forms.
3. Add fields such as customer name, car model, car number, booking date, pickup location, return date, rental amount, and booking status.
4. Use **Lookup** fields to connect the Customer and Car forms.
5. Create reports to display available cars, booking history, and customer details.
6. Test the application by performing car booking, updating booking status, and cancelling bookings.
7. Publish the application and verify that all booking records are stored and retrieved correctly.

Result

A cloud-based Car Booking System was successfully developed. The application allows customers to view available cars, make bookings, manage reservation details, and maintain customer and booking records efficiently.

Experiment: 4 Library Book Reservation System

1, Create a simple cloud software application for Library book reservation system for SIMATS library using any Cloud Service Provider to demonstrate SaaS include the necessary fields such as Title of the book, author, publications, Year, edition, no of copies, Rack no, status (taken/returned) etc.

Aim

To develop a cloud-based Library Book Reservation System for managing book details, member information, and book reservations. The system enables members to reserve books easily and helps maintain library records efficiently.

Procedure

1. Create a new application named **Library Book Reservation System**.
2. Create **Member Details**, **Book Details**, and **Book Reservation** forms.
3. Add fields such as member name, book title, author, ISBN, reservation date, return date, availability status, and reservation status.
4. Use **Lookup** fields to connect the Member and Book forms.
5. Create reports to display available books, reserved books, and member reservation history.
6. Test the application by reserving books, updating return status, and cancelling reservations.
7. Publish the application and verify that all reservation records are stored and retrieved successfully.

Result

A cloud-based Library Book Reservation System was successfully developed. The application allows members to search and reserve books, manage reservations, and maintain book and member records efficiently.

Experiment: 5 Mark Sheet Processing System

1. Create a simple cloud software application for Mark Sheet Processing System using any Cloud Service Provider to demonstrate SaaS include the necessary fields such as name of the student, Reg no of the student , Subjects , Marks, Average, percentage, rank, overall performance etc.

Aim

To develop a cloud-based Mark Sheet Processing System for managing student details, subject marks, and result generation. The system helps calculate total marks, percentage, and grade while maintaining student records efficiently.

Procedure

1. Create a new application named **Mark Sheet Processing System**.
2. Create **Student Details**, **Subject Marks**, and **Result** forms.
3. Add fields such as student name, roll number, subject name, marks obtained, total marks, percentage, grade, and result status.
4. Use **Lookup** fields to connect the Student Details and Subject Marks forms.
5. Create reports to display student mark sheets, grades, and result summaries.
6. Test the application by entering marks, generating the mark sheet, and verifying the calculated results.
7. Publish the application and ensure all student records and results are stored correctly.

Result

A cloud-based Payroll Processing System was successfully developed. The application enables organizations to manage employee

information, process salaries, generate payslips, and maintain payroll records accurately and efficiently.

Experiment:7 Student Attendance System

Create a simple cloud software application for Students Attendance System using any Cloud Service Provider to demonstrate SaaS include the necessary fields such as name of the students, course, present , Absent, course attendance, OD request, grade, attendance percentage, etc.

Aim To develop a cloud-based Student Attendance System for managing student details, class information, and attendance records. The system helps track daily attendance, generate attendance reports, and maintain student records efficiently.

Procedure

- Create a new application named **Student Attendance System**.
- Create **Student Details**, **Class Details**, and **Attendance** forms.
- Add fields such as student ID, student name, class, date, subject, attendance status (Present/Absent), and remarks.
- Use **Lookup** fields to connect the Student Details and Class Details forms.
- Create reports to display daily attendance, class-wise attendance, and student attendance history.
- Test the application by marking attendance, updating attendance status, and generating attendance reports.
- Publish the application and ensure all attendance records are stored and retrieved correctly.

Result

A cloud-based Student Attendance System was successfully developed. The application enables teachers to record daily attendance, monitor student attendance, generate attendance reports, and maintain attendance records accurately and efficiently.

Experiment: 8 Student Counselling System

Create a simple cloud web application for student counselling system using any Cloud Service Provider to demonstrate SaaS with the fields of student name, age, address, phone, subjects studied, Year of passing, percentage of marks, domain interest, etc.

Aim

To develop a cloud-based Student Counselling System for managing student details, counselling sessions, and counsellor records. The system helps monitor student progress, schedule counselling sessions, and maintain counselling records efficiently.

Procedure

1. Create a new application named **Student Counselling System**.
2. Create **Student Details**, **Counsellor Details**, and **Counselling Session** forms.
3. Add fields such as Student ID, Student Name, Counsellor Name, Department, Session Date, Counselling Type, Remarks, and Follow-up Status.
4. Use **Lookup** fields to connect the Student Details and Counsellor Details forms.
5. Create reports to display student counselling history, counsellor schedules, and follow-up records.
6. Test the application by scheduling counselling sessions, updating session details, and generating counselling reports.
7. Publish the application and verify that all counselling records are stored and retrieved successfully.

Result

A cloud-based Student Counselling System was successfully developed. The application enables institutions to schedule counselling sessions, maintain student counselling records, monitor follow-up activities, and generate counselling reports efficiently.

Experiment: 9 SIMATS Hospital Management System

Create a simple cloud software application for Hospital information system for SIMATS Hospital using any Cloud Service Provider to demonstrate SaaS with fields of patient name, age, address, phone, email, Attender name, attender phone, doctor name, diseases, etc.

Aim

To develop a cloud-based **SIMATS Hospital Management System** for managing patient details, doctor information, appointments, and medical records. The system helps improve hospital administration, streamline patient care, and maintain hospital records efficiently.

Procedure

1. Create a new application named **SIMATS Hospital Management System**.
2. Create **Patient Details**, **Doctor Details**, and **Appointment** forms.
3. Add fields such as Patient ID, Patient Name, Age, Gender, Doctor Name, Department, Appointment Date, Diagnosis, Treatment, and Bill Amount.
4. Use **Lookup** fields to connect the Patient Details and Doctor Details forms.
5. Create reports to display patient records, doctor schedules, appointment history, and billing details.
6. Test the application by registering patients, scheduling appointments, updating medical records, and generating reports.
7. Publish the application and verify that all hospital records are stored and retrieved successfully.

Result

A cloud-based **SIMATS Hospital Management System** was successfully developed. The application enables hospital staff to manage patient information, schedule appointments, maintain medical records, generate bills, and improve the overall efficiency of hospital operations.

Experiment: 10 Student Information System

Create a simple cloud software application to run a c program to display the student information using any Cloud Service Provider to demonstrate SaaS with the template of student name, reg no, address, phone, age, courses, grades and attendance report, progress report, Semester mark sheet forms

Aim

To develop a cloud-based Student Information System for managing student details, academic information, and personal records. The system helps maintain student information, monitor academic progress, and generate student reports efficiently.

Procedure

1. Create a new application named **Student Information System**.
2. Create **Student Details, Course Details, and Academic Records** forms.
3. Add fields such as Student ID, Student Name, Date of Birth, Gender, Department, Course, Year, Email, Phone Number, Address, and Academic Status.
4. Use **Lookup** fields to connect the Student Details and Course Details forms.
5. Create reports to display student profiles, course-wise student lists, and academic records.
6. Test the application by adding, updating, searching, and deleting student information.
7. Publish the application and verify that all student records are stored and retrieved successfully.

Result

A cloud-based **Student Information System** was successfully developed. The application enables institutions to manage student

information, maintain academic records, generate reports, and access student data accurately and efficiently.

Experiment: 11 Online Supermarket System

Create a simple cloud software application for online super market using any Cloud Service Provider to demonstrate SaaS with the template of customer name, address, phone, email, items, quantity etc. with the item classification form.

Aim

To develop a cloud-based Online Supermarket System for managing product details, customer information, and online orders. The system helps customers purchase products online and enables efficient management of orders and inventory.

Procedure

1. Create a new application named **Online Supermarket System**.
2. Create **Customer Details, Product Details, and Order Details** forms.
3. Add fields such as Customer ID, Customer Name, Product Name, Category, Quantity, Price, Order Date, Payment Method, Delivery Address, and Order Status.
4. Use **Lookup** fields to connect the Customer Details and Product Details forms.
5. Create reports to display available products, customer orders, sales records, and inventory status.
6. Test the application by placing orders, updating order status, processing payments, and generating sales reports.
7. Publish the application and verify that all customer, product, and order records are stored and retrieved successfully.

IMPLEMENTATION

The image shows a screenshot of a web application titled "Online Super Market" with a sidebar menu. The main content area is titled "Customer details" and contains a form with the following fields:

- Customer Name: Two input fields for First Name and Last Name.
- Email: A single input field.
- Phone: A dropdown for country code (India) and a text input for the number (81234 56789).
- Address: A large text area.
- City: A text input field.
- pincode: A text input field with a placeholder "#####".
- registration Date: A text input field with a placeholder "dd-MMM-yyyy".

A blue "Submit" button is located at the bottom of the form.

The image shows a screenshot of a web application titled "Online Super Market" with a sidebar menu. The main content area is titled "Customer details Report" and displays a table with the following data:

Customer ID	Customer Name	Email	Phone	City	pincode	registration Date

Result

The Online Super Market System was successfully implemented in Zoho Creator. It automates product management, order processing, billing, inventory tracking, and report generation, making supermarket operations faster and more efficient.

EXP-12

Demonstrate virtualization by Installing Type-2 Hypervisor in your device, create and configure VM image with a Host Operating system (Either Windows/Linux).

AIM:

To demonstrate virtualization by installing type-2 hypervisor in your device, create and configure VM image with a host operating system (either windows /linux).

PROCEDURE:

STEP 1: Download VMware workstation and installed as type 2hypervisor.

STEP2: Download ubuntu or tiny OS as iso image file.

STEP 3: In VMware workstation->create new VM.

STEP 4: Do the basic configuration settings.

STEP 5: Created tiny OS virtual machine.

STEP 6: Launch the VM.

IMPLEMENTATION:

STEP 1:DOWNLOAD VMWARE WORKSTATIONAND INSTALLED AS TYPE 2HYPERVISOR

STEP 2: IN VMWARE WORKSTATION->CREATE NEW VM

STEP 3: DO THE BASIC CONFIGURATION SETTINGS.

STEP 4: CREATED TINYOS VIRTUAL MACHINE

STEP 5: LAUNCH THE VM

EXP-13

Create a Virtual Machine with 1 CPU, 2GB RAM and 15GB storage disk using a Type 2 Virtualization Software.

Aim:

To create and configure a virtual machine with 1 CPU, 2 GB RAM, and 15 GB storage using VirtualBox as a Type-2 virtualization software.

Procedure:

Step 1: Open Oracle VirtualBox on the host computer.

Step 2: Select the already created Ubuntu VM and open Settings. **Step 3:** Go to System → Motherboard and set the memory to 2048 MB (2 GB).

Step 4: Go to System → Processor and set the processor count to 1 CPU.

Step 5: Open Storage and verify that the virtual hard disk is configured with 15 GB storage.

Step 6: Click OK, start the Ubuntu VM, and verify that it boots successfully.

IMPLEMENTATION:

Step 1: Open Oracle VirtualBox on the host computer.

Step 2: Select the already created Ubuntu VM and open Settings.

Step 3: Go to System → Motherboard and set the memory to 2048 MB (2 GB).

Step 4: Go to System → Processor and set the processor count to 1 CPU.

Step 5: Open Storage and verify that the virtual hard disk is configured with 15 GB storage.

Step 6: Click OK, start the Ubuntu VM, and verify that it boots successfully.

EXP-14

Create a Virtual Hard Disk and allocate the storage using VM ware Workstation

Aim:

To create a virtual hard disk and allocate storage to it using VirtualBox.

Procedure:

Step 1: Open VMware Workstation and select the existing Ubuntu virtual machine.

Step 2: Click Edit virtual machine settings.

Step 3: Select Hard Disk and click Add to create a new virtual hard disk.

Step 4: Select Hard Disk → SCSI as the virtual disk type.

Step 5: Select Create a new virtual disk and allocate the required storage, such as 15 GB.

Step 6: Click Finish and verify that the new virtual hard disk is attached to the Ubuntu VM.

IMPLEMENTATION:

Step 1: Open VMware Workstation and select the existing Ubuntu virtual machine.

Step 2: Click Edit virtual machine settings.

Step 3: Select Hard Disk and click Add to create a new virtual hard disk.

Step 4: Select Hard Disk → SCSI as the virtual disk type.

Step 5: Select Create a new virtual disk and allocate the required storage, such as 15 GB.

Step 6: Click Finish and verify that the new virtual hard disk is attached to the Ubuntu VM.

EXP-15

Create a Snapshot of a VM and Test it by loading the Previous Version/Cloned VM

Aim:

To create a snapshot of a virtual machine and restore the previous version using VMware Workstation.

Procedure:

Step 1: Start the Ubuntu VM in VMware Workstation and create a test file or folder.

Step 2: Shut down or suspend the VM and open the Snapshot option.

Step 3: Select Take Snapshot and enter a name such as Before_Changes.

Step 4: Start the VM again and make some changes, such as creating a new file.

Step 5: Open Snapshot Manager, select the Before_Changes snapshot, and click Go To/Restore.

Step 6: Start the VM and verify that the changes made after the snapshot have been removed.

IMPLEMENTATION:

Step 1: Start the Ubuntu VM in VMware Workstation and create a test file or folder.

Step 2: Shut down or suspend the VM and open the Snapshot option.

Step 3: Select Take Snapshot and enter a name such as Before Changes.

Step 4: Start the VM again and make some changes, such as creating a new file.

Step 5: Open Snapshot Manager, select the Before_Changes snapshot, and click Go To/Restore.

Step 6: Start the VM and verify that the changes made after the snapshot have been removed.

EXP-16

Create a Cloning of a VM and Test it by loading the Previous Version/Cloned VM

Aim:

To create a clone of an existing virtual machine and test the cloned virtual machine using VMware Workstation.

Procedure:

Step 1: Shut down the existing Ubuntu VM completely.

Step 2: Open VMware Workstation and select VM → Manage → Clone.

Step 3: Select the current state of the virtual machine as the cloning source.

Step 4: Select Create a Full Clone and give the cloned VM a name such as Ubuntu_Clone.

Step 5: Complete the cloning process and start the Ubuntu_Clone virtual machine.

Step 6: Create a test file in the cloned VM and verify that it does not appear in the original Ubuntu VM.

IMPLEMENTATION:

Step 1: Shut down the existing Ubuntu VM completely.

Step 2: Open VMware Workstation and select VM → Manage → Clone.

Step 3: Select the current state of the virtual machine as the cloning source.

Step 4: Select Create a Full Clone and give the cloned VM a name such as Ubuntu_Clone.

Step 5: Complete the cloning process and start the Ubuntu_Clone virtual machine.

Step 6: Create a test file in the cloned VM and verify that it does not appear in the original Ubuntu VM.

EXP-17

Change Hardware compatibility of a VM (Either by clone/create new one) which is already created and configured and run simple unix commands

Aim:

To change the hardware configuration and compatibility of an existing virtual machine using VMware Workstation.

Procedure:

Step 1: Shut down the existing Ubuntu VM and open Edit virtual machine settings.

Step 2: Go to Hardware and change the memory from 2 GB to 4 GB. **Step 3:** Change the processor configuration from 1 CPU to 2 CPUs. **Step 4:** Open Options → Advanced and check the virtual machine's hardware compatibility settings.

Step 5: If required, use Manage → Change Hardware

Compatibility and select the required VMware hardware version. **Step 6:** Apply the changes, start Ubuntu, and verify that the modified hardware configuration works correctly.

IMPLEMENTATION:

Step 1: Shut down the existing Ubuntu VM and open Edit virtual machine settings.

Step 2: Go to Hardware and change the memory from 2 GB to 4 GB.

Step 3: Change the processor configuration from 1 CPU to 2 CPUs.

Step 4: Open Options → Advanced and check the virtual machine's hardware compatibility settings.

Step 5: If required, use Manage → Change Hardware Compatibility and select the required VMware hardware version.

Step 6: Apply the changes, start Ubuntu, and verify that the modified hardware configuration works.

EXPERIMENT18:

Install Virtualbox/VMware Workstation with different flavours of linux or windows OS on top of your present windows environment.

Aim

To install VirtualBox and create a virtual machine with a different Linux or Windows operating system on the existing Windows environment.

Short Procedure

1. Download and install Oracle VirtualBox on the Windows system.
2. Download the ISO file of the required Linux/Windows OS.
3. Open VirtualBox and select Create New Virtual Machine.
4. Enter the VM name and select the downloaded ISO file.
5. Allocate suitable RAM, CPU cores, and virtual hard-disk space.
6. Start the virtual machine and follow the OS installation instructions.
7. Complete the installation and restart the virtual machine.
8. Verify that the newly installed OS runs successfully inside the virtual environment.
